Since the infrared transmission of semiconductor  
specimens is influenced not only by the layer thickness  
and the doping but also by the surface condition of the  
specimens, infrared measurements may be used for  
the investigation of semiconductor surfaces. Pre-  
requisite is the exclusion of influences by layer thick-  
nesses and dopings. Under favorable experimental

Germanium, Tantalum.

A method is described for the nondestructive measure-  
ment of the thickness of thin films transmitting infra-  
red light. The process, based on measurements of re-  
flection power and the transmission of infrared light,  
can be used for film thicknesses from 0.02 to 10  $\mu\text{m}$ .
